Configure the Citrix StoreFront connector

Last Modified on 2026-09-24

The StoreFront connector can create packages for three kinds of levels of integration:

- Default: Simple integration, where the end user will be directed to the StoreFront website with a launch action embedded in the URL.
- Enhanced: Extended integration that requires a special script on the StoreFront website which will hide the StoreFront portal when launching an application (with the tab/popup auto closing if possible)
- Enhanced (legacy): Legacy support, not recommended

Citrix Studio/StoreFront configuration

- HTTP Basic authentication must be enabled (this is required for the Application Workspace StoreFront connector).
- In the **Actions** pane > **Manage Receiver for Web Sites** > **Website Shortcuts**, add the Application Workspace URL (e.g. https://workspace.recastsoftware.com). If an ADC is used, add the Virtual Server URL of the ADC next to the Application Workspace URL.
- In the **Actions** pane > **Manage Receiver for Web Sites** > **Advanced Settings**, uncheck the **Prompt for untrusted shortcuts** option.

For more information about the settings of the Citrix StoreFront connector, see Citrix StoreFront.
