StoreFront integration script

Last Modified on 2026-09-24

The Citrix StoreFront integration script allows Application Workspace to open applications directly, with an improved user experience.
The script should be placed on each StoreFront store that will be accessed from Application Workspace. The default location for the custom scripts is `C:\inetpub\wwwroot\Citrix\StoreWeb\custom`.

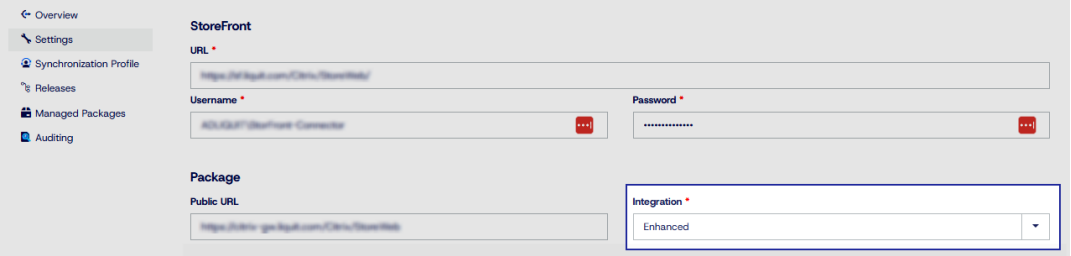

> When using the Application Workspace Browser, you'll need to enable Protocol Handling on the Citrix StoreFront server.
> If protocol handling is not enabled, the end user will be presented with the option to download the ICA file.

You can download the Citrix StoreFront integration script on the Application Workspace Downloads page.

To configure the integration:

1. On the **Connectors** page, double-click on the Citrix StoreFront connector to open its details page.

2. On the **Settings** tab, set the **Integration** to 'Enhanced'.
An Enhanced integration allows the integration script on the StoreFront website to hide the StoreFront portal when launching an application (with the tab/popup auto-closing, if possible).

3. Save your changes.
