

Access a hidden identity source

Last Modified on 04.23.26

When you have multiple identity sources configured, you have the ability to selectively conceal them if you don't wish to display them to the customer. These concealed identity sources can still be accessed by using specific parameters within the URL of your Application Workspace zone in your web browser.

For instance, consider the following URL:

`https://workspace.recastsoftware.cloud/?sso=0&identitySource=local`

In the following scenario, there are three configured identity sources. To emphasize AzureAD as the primary source, two of them have been marked as hidden.

Name	Type	Enabled	Hidden
LOCAL	Local	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Recast Software	Microsoft Entra ID (Azure AD)	<input checked="" type="checkbox"/>	<input type="checkbox"/>

The **Hidden** option is in the **Overview** screen of the identity source:

LOCAL

Overview

Name: LOCAL

Type: Local

Enabled

Display name: **Hidden**

Description:

In this scenario, you can still access the LDAP identity source by specifying its name in the URL:

`https://workspace.recastsoftware.cloud/?sso=0&identitySource=AD`
