

Create a category and assign packages to it

Last Modified on 04.23.26

Before creating a category, make sure the desired packages are created.

1. Go to **Manage > Workspace > Categories**.
 2. Click **+ Create** in the table toolbar.
 3. In the **Create category** dialog box that opens, in **Overview**, fill in the necessary info. Click **Next**.
 4. In **Summary**, leave the **Modify category after creation** selected. Click **Next**.
 5. In the detailed view screen that opens, in **Packages**, search for the necessary package and add it.
 6. Double-click the entry of the package to open it.
 7. Go to **Entitlements** and add the necessary identities. This step makes the category available for the user in the Side Menu of **Workspace** or **Catalog**, depending on where you configured the package to be published.
