Deploy a package with hidden entitlement

Last Modified on 2026-09-24

Scenario

You have a script which synchronizes to OneDrive the SharePoint sites the user can access. The script also removes the SharePoint sites the user is not entitled to anymore, but which are still synced to OneDrive.

You need this script to run automatically on the user devices without relying on user interaction.

Steps

1. Add a new entitlement to the package.
2. In the **Add entitlement** dialog box that opens,
    - In the **Overview** tab, **Publish** field, select *Hidden*.
    - In the **Events** tab add a 'Application Workspace Logon' type event, with a 'Launch' type action.
3. Click **Confirm**.

The package will start when the entitled user logs in to Application Workspace, without requiring manual user interaction. Now the package will not be visible in the Application Workspace, since no user interaction is needed.
