Update a managed package from Application Workspace Setup Store

Last Modified on 2026-09-24

You can update a managed package manually or automatically.

In this article, we'll use Mozilla Firefox as an example of updating a managed package created from the Application Workspace Setup Store. Application Workspace Setup Store is configured with the on-demand synchronization method, the only one supported.

To manually update the managed package:

1. Open the Mozilla Firefox package and navigate to **Overview** > **Updates**.

2. Select the new version of Mozilla Firefox and click **Apply update**.

To update the managed package automatically:

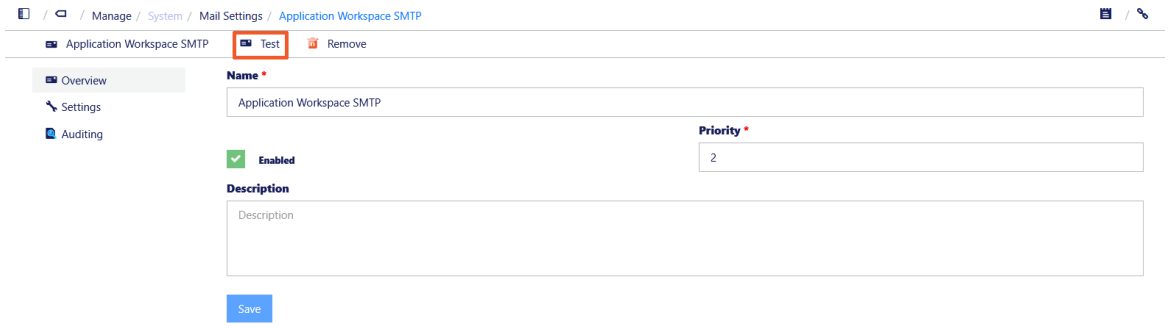

Configure the email settings

To receive e-mail notifications within Application Workspace, you first have to add an email server in **Manage** > **Mail Settings**.

Click **Create** and configure all the necessary settings for this email server. This email server is used by the scheduled tasks to send email messages. For more information, see Mail Settings.

Test the e-mail server

Don't forget to use the **Test** option in the **Overview** screen, to see if the configuration is working correctly.

Create a scheduled task

1. Navigate to **Manage** > **Automation** > **Scheduled Tasks**.

2. Click **Create**.

3. In the **Create scheduled task** that opens, select the 'Synchronize connector' type.

4. Under **Settings**:
   - Select an existing Application Workspace Setup Store.
   - Select **Download and apply updates**.
   - Enable **Send detailed per package notifications**. By using this option you will receive, per managed package, a very detailed email message containing information such as release notes, CVE, CVSS information (if applicable), and the virus scan score. This information is important for risk mitigation.

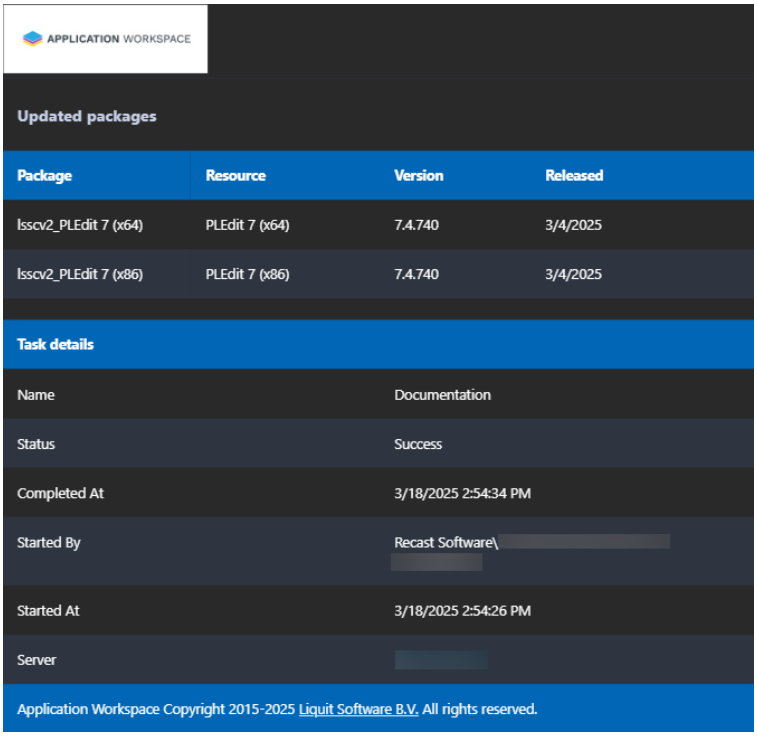

- Select to which DTAP stage you want to deploy the updated package. Note that the default option represents the stage configured in the **Releases** screen of the connector.

5. In the **Summary**, leave the **Modify package after creation** selected and click **Finish**.

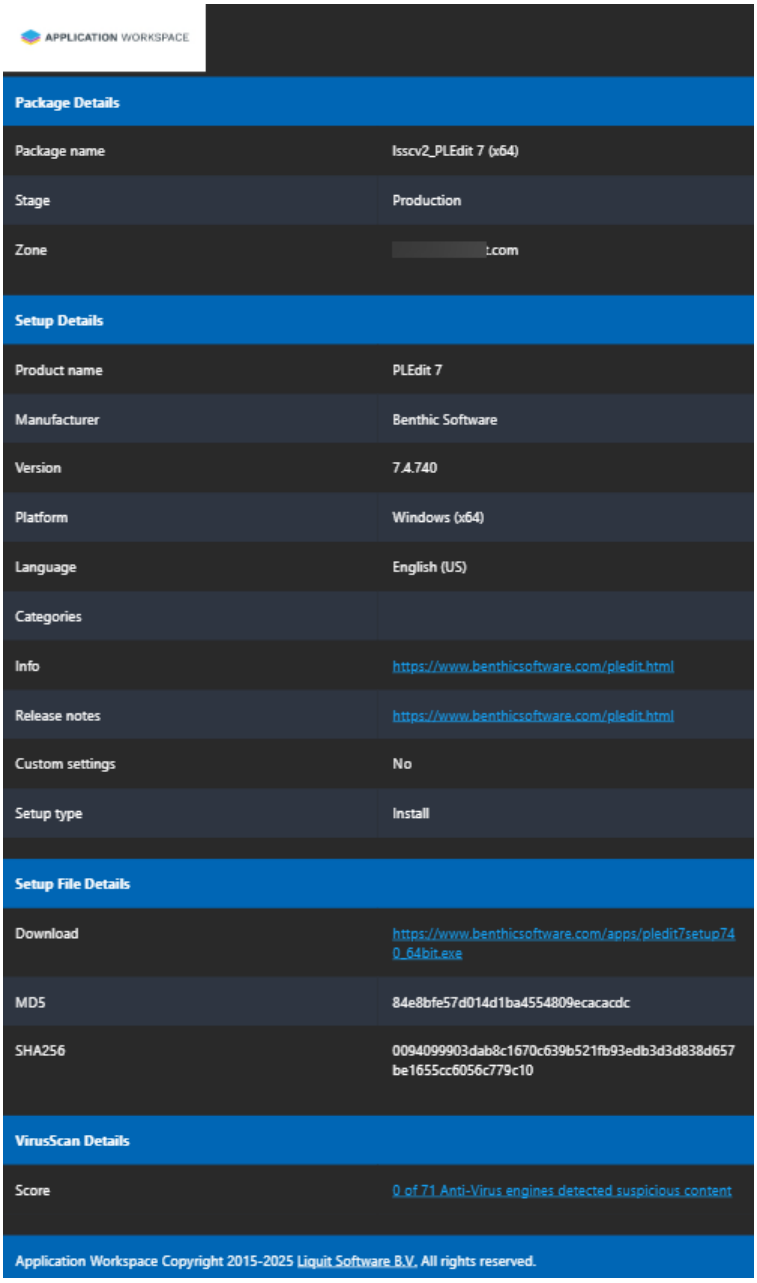

6. Navigate to **Notifications** and enable the notification and add one or more email addresses where Application Workspace should send detailed emails per managed package.

7. Navigate to **Schedule** and add a new schedule where you specify the desired frequency and time.

How the email notification looks like when an automatic update is applied:
