

Use your own company domain name as virtual host

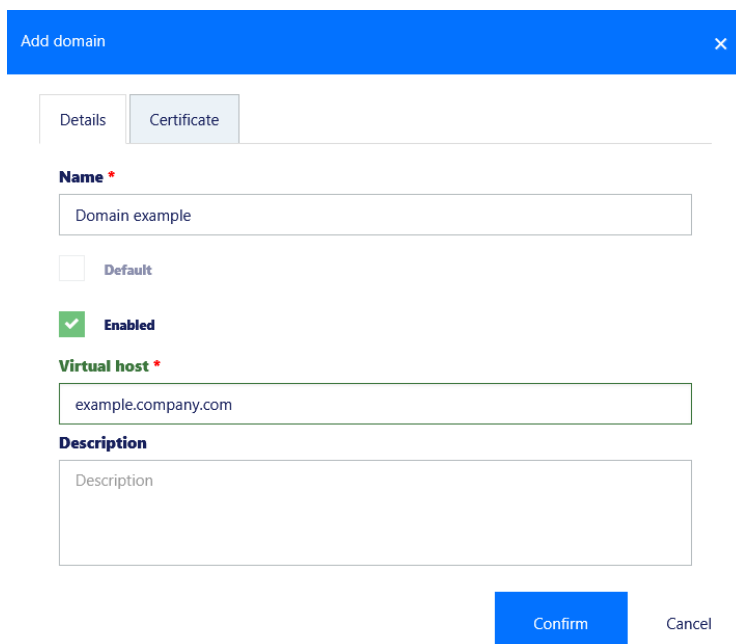

Last Modified on 04.23.26

Application Workspace delivers a standard domain (virtual host) to its partners. Some partners use this default virtual hostname to identify and access the specific Application Workspace Systems or services. Most of the partners want to use their domain. In this article, we describe how to create your virtual host name inside the domain section of Application Workspace.

1. Navigate to **Manage > System > Domains**. Here you will find the default virtual hostname.

2. Click on **+ Add**.
3. In the **Details** tab fill in the needed information.

A screenshot of the 'Add domain' form. The form has a blue header with 'Add domain' and a close button. Below the header are two tabs: 'Details' (selected) and 'Certificate'. The 'Details' tab contains the following fields:

- Name ***: A text input field containing 'Domain example'.
- Default**
- Enabled**
- Virtual host ***: A text input field containing 'example.company.com'.
- Description**: A text area with the placeholder text 'Description'.

At the bottom of the form are two buttons: 'Confirm' (blue) and 'Cancel'.

4. In the **Certificate** tab upload your company certificate or use the ACME service.

Add domain ×

Details Certificate

Use ACME for automatic certificate renewal

Automated Certificate Management Environment can be used for automatic certificate management

Name	Virtual host
🌐 Example domani	example.company.com
🌐 Default	

⏪ ⏩ Page 1 of 1 1000 items per page

6. Create a CNAME (canonical name) DNS record from `example.company.com` to `beta.liquid.cloud`.

7. Test if you can resolve the newly added domain within your browser or terminal (cmd: NSLOOKUP example.company.com). It should resolve `beta.recastsoftware.com`.

Important information

- Please note that you must maintain a certificate (with ACME or a company certificate).
- You can never create another `<example>.recastsoftware.cloud` domain.
