

Use your own company domain name as virtual host

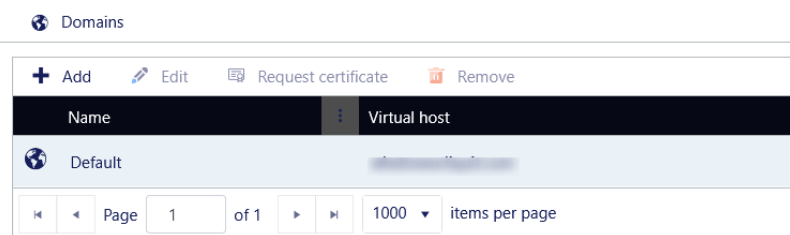

Last Modified on 2026-06-26

Application Workspace delivers a standard domain (virtual host) to its partners. Some partners use this default virtual hostname to identify and access the specific Application Workspaces or services. Most of the partners want to use their domain.

In this article, you'll learn how to create your virtual host name inside the domain section of Application Workspace.

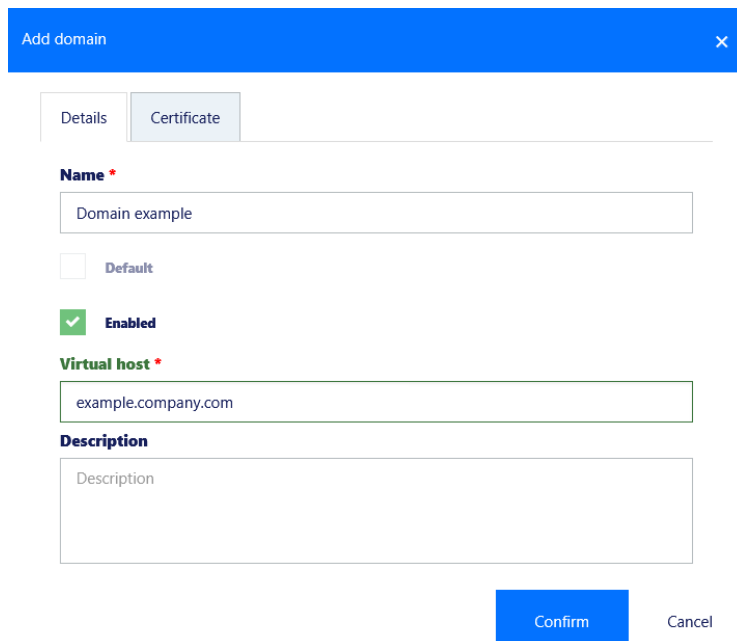

To create your virtual host name inside the domain:

1. Navigate to **Manage > System > Domains**. This is where you will find the default virtual hostname.

2. Click **Add**.

3. In the **Add domain** window that opens, on the **Details** tab, enter a domain name, the virtual hostname, and a description. Click **Confirm**.

A screenshot of the 'Add domain' dialog box. The dialog has a blue header with the text 'Add domain' and a close button (X). Below the header are two tabs: 'Details' (selected) and 'Certificate'. Under the 'Details' tab, there are several fields: a 'Name' field with the text 'Domain example', a 'Default' checkbox (unchecked), an 'Enabled' checkbox (checked with a green checkmark), a 'Virtual host' field with the text 'example.company.com', and a 'Description' field with the text 'Description'. At the bottom of the dialog, there are two buttons: 'Confirm' (blue) and 'Cancel' (grey).

4. On the **Certificate** tab, upload your company certificate or enable **Use ACME for automatic certificate renewal**. Click **Confirm**.

5. Create a CNAME (canonical name) DNS record from `example.company.com` to `beta.liquid.cloud`.

6. Test that you can resolve the newly added domain within your browser or terminal (cmd: `NSLOOKUP <example.company.com>`). It should resolve `beta.recastsoftware.com`.

Important information

- You must maintain a certificate (with ACME or a company certificate).
- You won't be able to create another `<example>.recastsoftware.cloud` domain.
