

Canon EOS Webcam Utility Pro

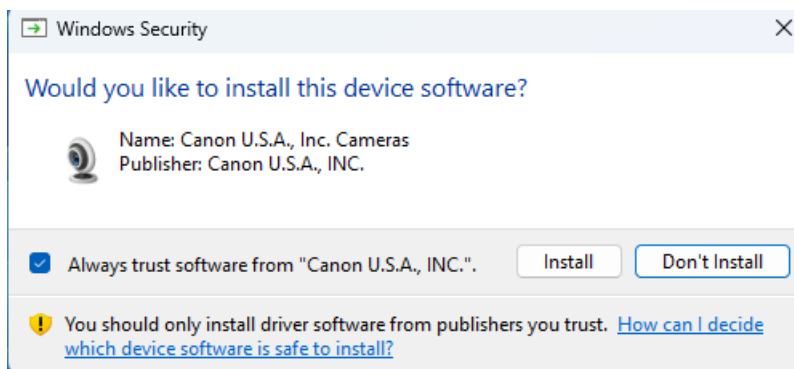

Last Modified on 04.16.26

Unattended installation

If you want to install EOS Webcam Utility Pro silently, there are some extra steps you have to take.

Prerequisites

- Canon Device Software – Normally when you install EOS Webcam Utility Pro, you get an extra popup to allow the installation of this software. If you don't install it, the unattended installation will fail.

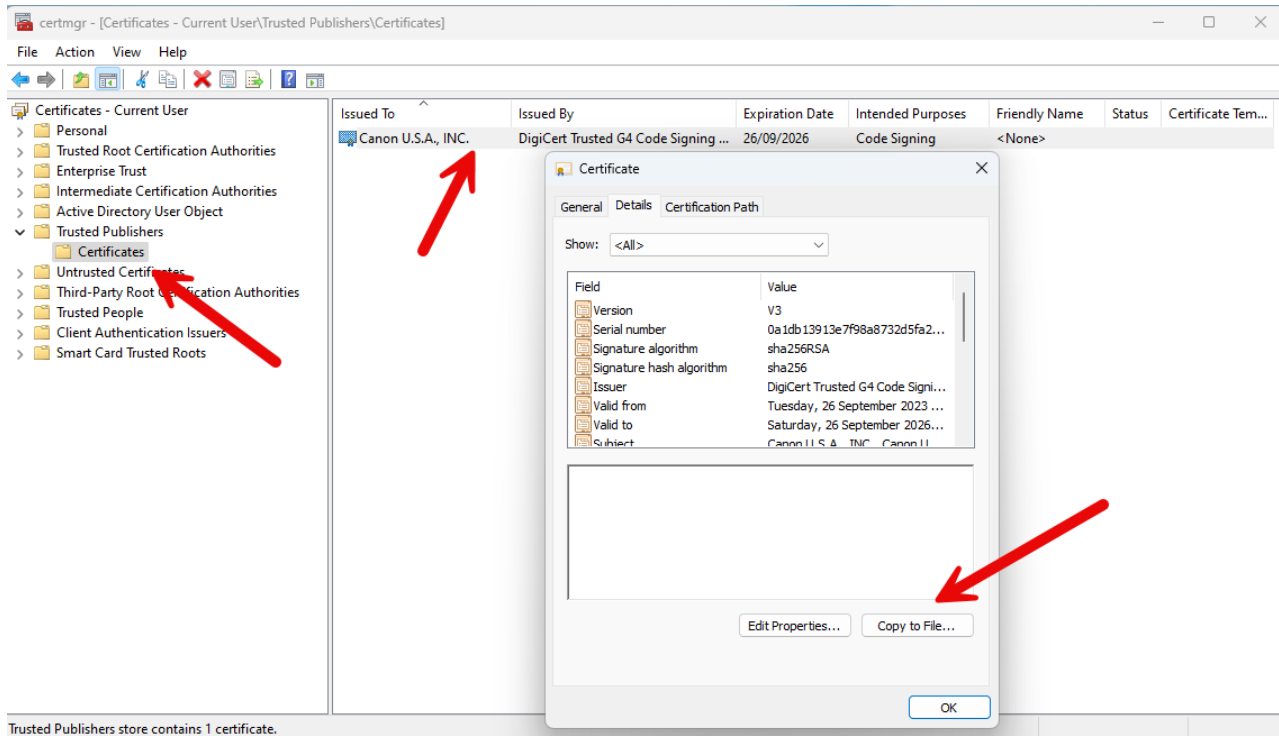

- Canon Certificate – You have to install or inject this certificate. You can obtain this certificate on a machine where EOS Webcam Utility Pro is installed.

Exporting the Canon Certificate

1. Install EOS Webcam Utility Pro on a test machine or VM.
2. Start `certmgr.msc`.
3. Locate the certificate in the **Tusted Publishers > Certificates** section.
4. Double-click the 'Canon' certificate.
5. Click the **Details** tab.
6. Click **Copy to file**.
7. Accept the Wizard defaults and choose a location and filename for the certificate.
8. Copy the .cer file to a save place outside the test machine.

Recast

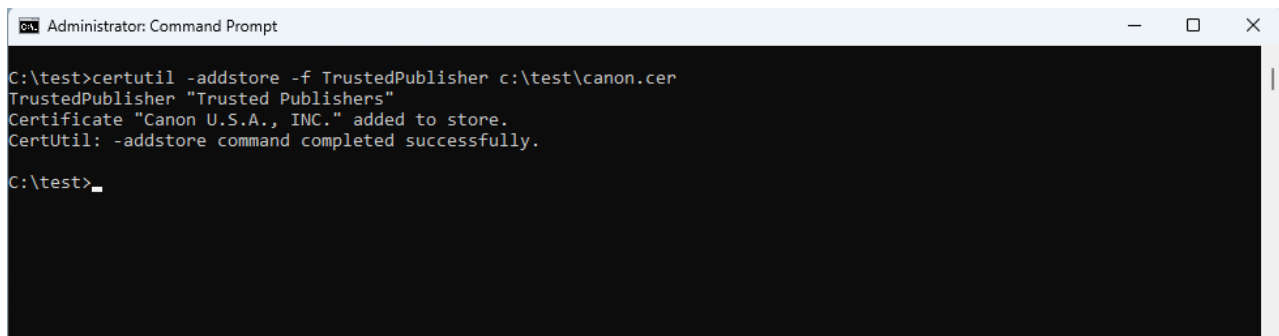

Importing the Canon Certificate

On the machine or image where you want the certificate installed, open an elevated command prompt and type:

```
certutil -addstore -f TrustedPublisher [drive]\[path]\[certificate]
```

Example: `certutil -addstore -f TrustedPublisher c:\test\canon.cer`

When the certificate is successfully installed the following message will be displayed:

You can now do a silent install of EOS Webcam Utility Pro.
