

DIALux evo

Last Modified on 04.16.26

Silent installation of DIALux evo is supported by the vendor. But it doesn't include a switch to prevent a reboot.

By default, a reboot can only be prevented using `/s:<configfile>` and a `silentsetup.ini` file including the NoRestart option shown below:

```
[SetupValues]
%AppFolder%=C:\Program Files\DIAL GmbH\DIALux evo
%AppShortcutFolderName%=DIALux evo
**%NoRestart%=1**
```

A managed package in Liquit Workspace doesn't support uploading an additional configuration file like the `silentsetup.ini` above. This means, that to support this, you need to add it manually.
