

Recast

Dropbox

Last Modified on 04.16.26

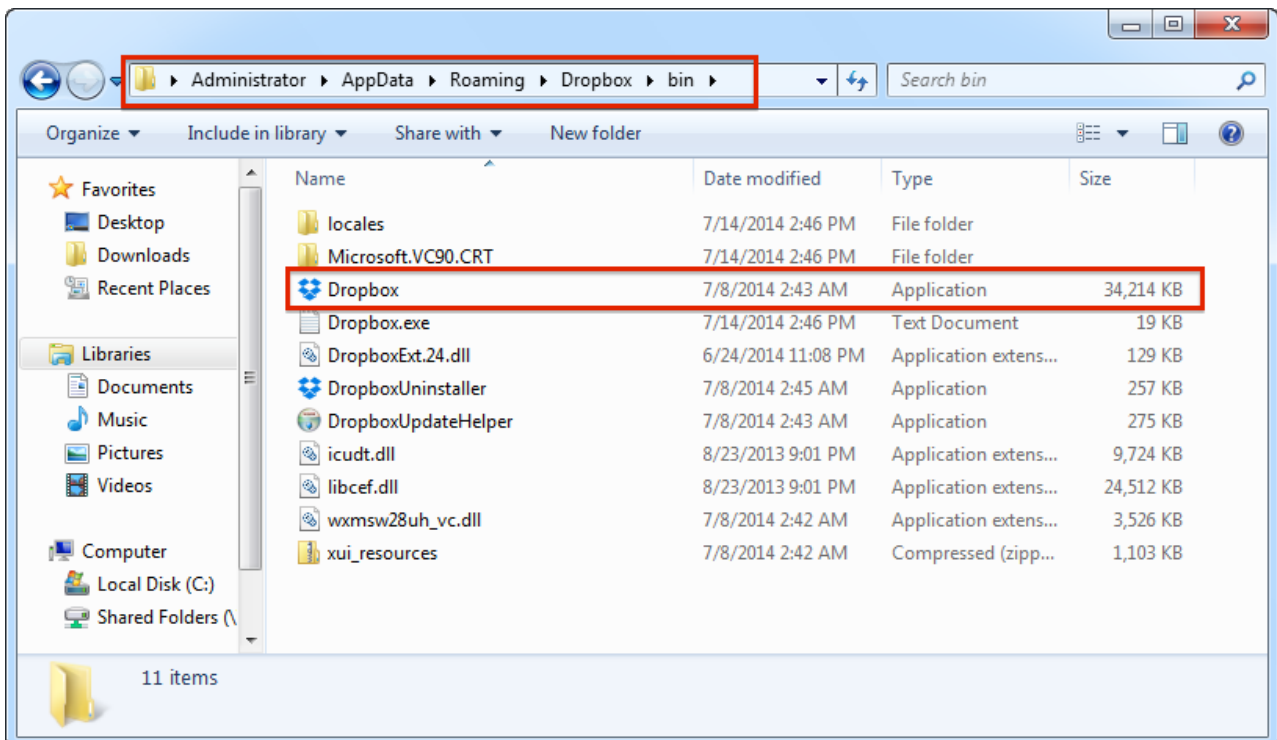

Dropbox is a popular application widely used in personal, educational and professional environments.

Unfortunately, the installation of Dropbox doesn't have switches or registry settings to tailor the application. The only switch you can use is /S, to install silently.

There are two aspects you should be aware of:

- First of all, Dropbox doesn't install in 'Program Files' but in `Users/username/AppData/Roaming/Dropbox`

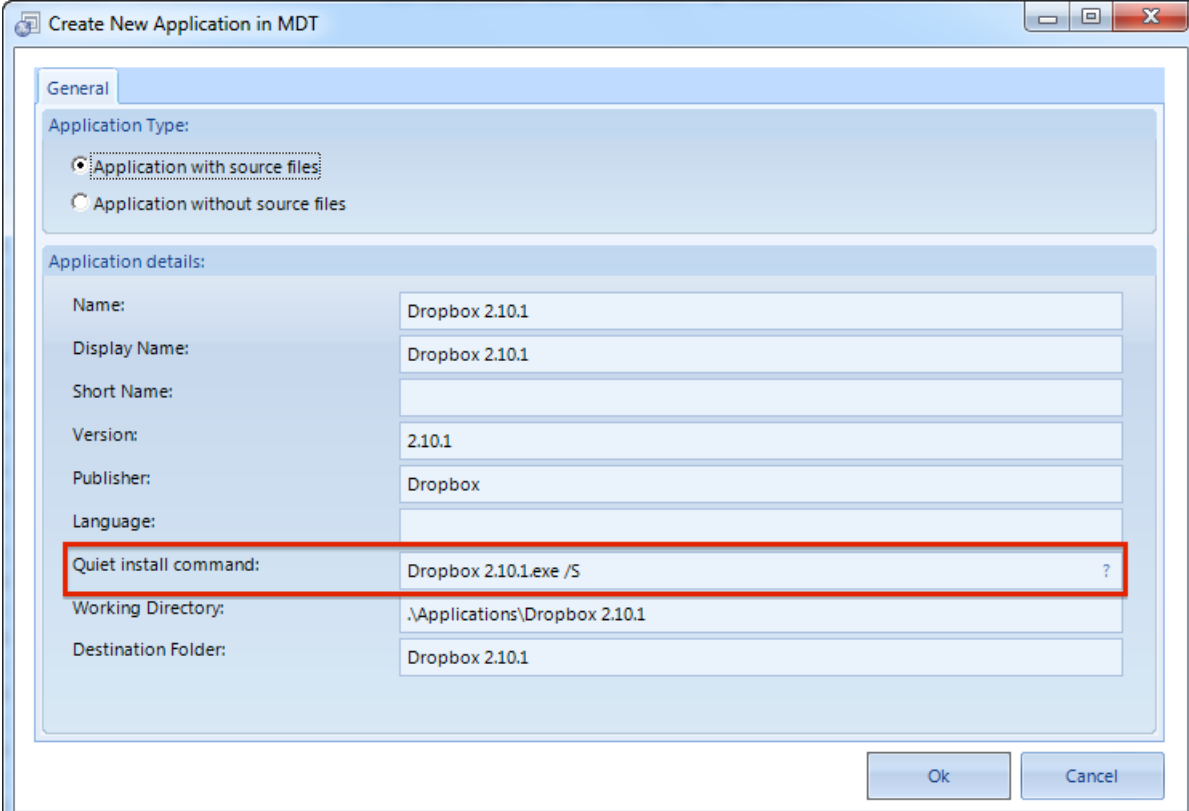

- Second, Dropbox updates itself automatically. And because it's installed in the 'Users' directory, no matter what rights the user has to install applications, he always has rights in his user directory. So there is no way to prevent

Recast

Dropbox from updating itself.

You have to install Dropbox with user rights, not administrator ones. Unfortunately, you lose the shell extension, but otherwise the application will not install properly.

The screenshot shows a dialog box titled "Create New Application in MDT". It has a "General" tab selected. Under "Application Type", the "Application with source files" radio button is selected. The "Application details" section contains the following fields:

Name:	Dropbox 2.10.1
Display Name:	Dropbox 2.10.1
Short Name:	
Version:	2.10.1
Publisher:	Dropbox
Language:	
Quiet install command:	Dropbox 2.10.1.exe /S
Working Directory:	.\Applications\Dropbox 2.10.1
Destination Folder:	Dropbox 2.10.1

At the bottom right, there are "Ok" and "Cancel" buttons. The "Quiet install command" field is highlighted with a red border.
