K-Lite Codec Pack

Last Modified on 04.16.26

If you want to install the K-Lite Codec Pack silently you must take the following steps:

1. First, download the Codec Pack version you want from the Setup Store.
2. After downloading, open a command line prompt and go to the location of the downloaded file.
3. you need to create an .ini file which contains the settings you want to use. To create this file, run the installer like this:

K-Lite_Codec_Pack_1055_Standard.exe -MakeUnattended

This opens a wizard in which you can select the components and other settings. This will not install the Codec Pack. After you finish, there are 2 files in the same directory as the installer. In our case, we used the Standard version of the Codec Pack, so the files are named:

- klcpl_standard_unattended.bat

Recast

- klcp_standard_unattended.ini

The .ini file can now be used next to the other settings in the 'Quiet install command' box to create the application. The box is pre-filled with best-practice settings. You can view more settings when clicking the '?' at the end of the box.

The screenshot shows the 'Create New Application in MDT' dialog box. The 'General' tab is selected. Under 'Application Type', 'Application with source files' is chosen. The 'Application details' section contains the following fields:

Name:	K-Lite Codec Pack 10.5.5
Display Name:	K-Lite Codec Pack 10.5.5
Short Name:	
Version:	10.5.5
Publisher:	K-Lite
Language:	
Quiet install command:	K-Lite_Codec_Pack_1055_Standard.exe /veryilent /norestart /LoadInf=""\klcp_standard_unattended.ini ?
Working Directory:	.\Applications\K-Lite Codec Pack 10.5.5
Destination Folder:	K-Lite Codec Pack 10.5.5

The 'Quiet install command' field is highlighted with a red box. At the bottom right, there are 'Ok' and 'Cancel' buttons.
