

## K-Lite Codec Pack

Last Modified on 2026-05-21

To install the K-Lite Codec Pack silently:

1. Download the Codec Pack version you want from the Setup Store.
2. Open a command line prompt and go to the location of the downloaded file.
3. Create an .ini file which contains the settings you want to use. To create this file, run the installer like this:

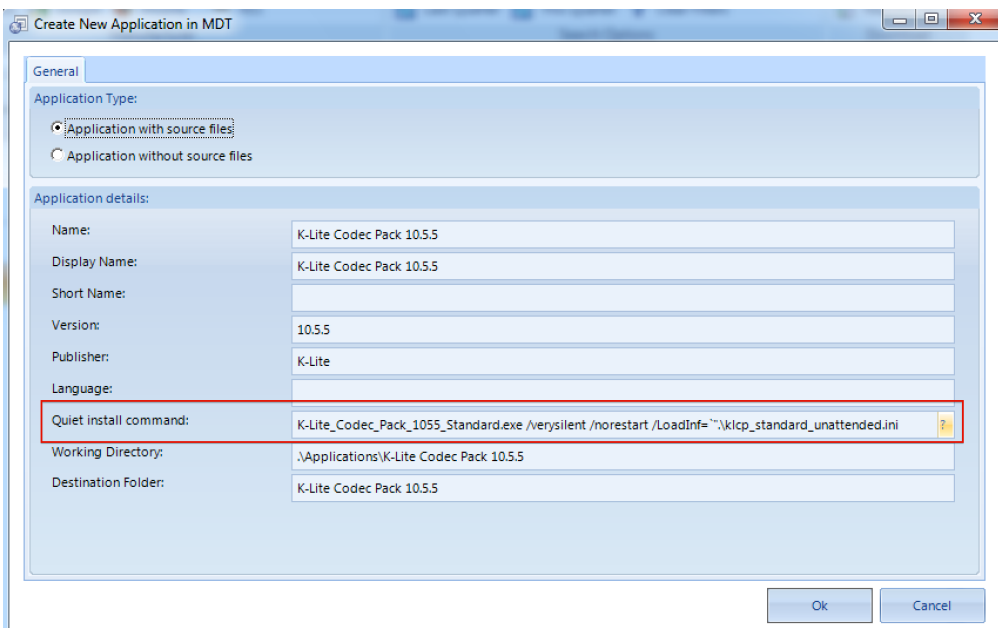

```
K-Lite_Codec_Pack_1055_Standard.exe -MakeUnattended
```

This opens a wizard in which you can select the components and other settings. This will not install the Codec Pack. After you finish, there are 2 files in the same directory as the installer. In our case, we used the Standard version of the Codec Pack, so the files are named:

- klcp\_standard\_unattended.bat
- klcp\_standard\_unattended.ini

The .ini file can now be used next to the other settings in the 'Quiet install command' box to create the application. The box is pre-filled with best-practice settings. You can view more settings when clicking the '?' at the end of the box.
