

## Liquit.GetSources

Last Modified on 04.16.26

The *Liquit.GetSources* function allows you to retrieve the identity sources known in the Application Workspace, as well as to determine the authentication method required by them.

### Request parameters

Name	Description
description	The description provided for the identity source.
displayname	The name of the identity source which is displayed to the user.
hidden	This identity source is not listed as a selectable option but can be used to log in.
id	The id of the identity source.
methods	The methods available for the identity source <ul style="list-style-type: none"><li>Federated – if this method is available, the <i>Liquit.SSO</i> function can be used to authenticate to this identity source.</li><li>Login – If this method is available, the <i>Liquit.Login</i> function can be used to authenticate against this identity source.</li></ul>

### Example

```
Liquit.GetSources(  
  (result ) => {  
  
    //The result parameter will contain the identity source information.  
    console.log(result);  
  
  }  
);
```
