

## Retrieve entitlements and events for a package

Last Modified on 04.16.26

When you want to retrieve the entitlements and event/triggers of a package you can use the script offered as an example in this article.

First, you must connect to the zone with Application Workspace Powershell Module as described in [Getting Started](#).

Then run the following script:

```
$entitlements = Get-LiquidPackageEntitlement -Package $package

for ($i = 0; $i -lt $entitlements.Count; $i++) {

$identity=$entitlements[$i].Identity

$events=$entitlements[$i].Events

Write-Host"Identity:"

Write-Host" Type: $($identity.Type)"

Write-Host" Name: $($identity.Name)"

Write-Host" DisplayName: $($identity.DisplayName)"

Write-Host" ID: $($identity.ID)"

Write-Host"Events:"

foreach ($eventin$events) {

Write-Host" Type: $($event.Type)"

Write-Host" ActionSet: $($event.ActionSet)"

Write-Host" Collection: $($event.Collection)"

}

}
```
