The Generic MSI Import Wizard

This option lets you select a directory in which multiple MSI packages have been stored. The best practice is to have a separate subdirectory per software product.

1. Click the Browse button in the upper left corner of the MSI Import Wizard to select the directory with MSI packages you want to import.
 2. When the MSI packages have been listed in the grid, click **Import** to import the setups (ConfigMgr only).
 3. Use the **Property** grid to configure how you want the applications to be created.
