Apps greyed out after Edge update – Local Network Access prompt

Last Modified on 2026-11-10

Starting with Microsoft Edge version 143, which introduced the Local Network Access feature, when accessing the Application Workspace URL you may see a prompt stating: '[domain] wants to look for and connect to any device on your local network.

If you **Block** access, applications in Application Workspace appear as greyed out.

Selecting **Allow** resolves the issue and adds the URL to Edge's allowed list under **Privacy, search, and services** > **Site permissions** > **All permissions** > **Local network access**.

You can also configure this setting via Intune using a configuration profile. For more details, see Configure Microsoft Edge policy settings with Microsoft Intune and LocalNetworkAccessAllowedForUrls.
