Application Workspace environment variables not updated in real-time

Last Modified on 2026-09-28

Application Workspace will use environment variables and their value from the start of the Universal Agent (Application Workspace Service) and will not update the values while running. If filters, actions, and processes use environment variables Application Workspace will use the startup values and not the current values. Only environment variables and the value changed with the actions “Set environment variable” or “Unset environment variable” will be updated. New environment variables that did not exist during the start will be picked up.
