View Packages

Last Modified on 2026-09-24

The Application Workspace **Packages** page displays information about all your packages such as the type of package, whether it is enabled, its display name, and any tags applied to the package.

From this page, you can:

- Create a new package or edit an existing one
- Copy an existing package, as a starting point for a creating a new one
- View the Release overview
- Review the contents of the Recycle bin

View the Release Overview

The **Release overview** can help you determine which packages need to be updated. It displays the name and type of a package, if it is enabled or managed, the version number (if they exist) corresponding with all release stages (Development, Test, Acceptance and Production), and the source of the app (the Application Workspace Setup Store, for example).

You can access the release overview by clicking on the **Release overview** button in the table toolbar.

> The release overview for packages requires a Release and Patch Management license.

Review Recycle Bin Contents

When you remove a package, it will be moved to the recycle bin and will remain here until the Clean Packages scheduled task is executed or until you manually delete it.

You can also do the following:

Restore one or more packages you previously selected. Whenever Application Workspace encounters a package with the same name, you will be prompted to rename the package to avoid duplicates. When a package is successfully restored, it is moved back to the list of packages and can be assigned and edited like any other package within the list.

Remove one or more packages you previously selected from the system. This action is permanent; there is no way to restore them afterwards.
