

## Package Types

Last Modified on 2026-06-23

There are 7 types of packages that you can create. All these types come with predefined basic settings, except for **Custom package** which is blank.

- **Install MSI**  
Install an .MSI package, by uploading it or providing Application Workspace the network credentials to access it.
- **Install Mac App**  
Install an app via a .PKG file on an MacOS platform.
- **Custom package**  
Unlike the other types of packages that have some settings preconfigure for you to cover the basics, a custom package represents a complete blank template.
- **Local application**  
Configure a launch action for an existing local app from the user's device.
- **Modify group membership**  
Change the group memberships for Microsoft Entra ID (Azure AD) and Active Directory. As a prerequisite for Microsoft Entra ID (Azure AD), you need to go to **Identity Sources > Settings > Synchronization > Modifications** and select *Group membership*. As a prerequisite for LDAP, you need to go to **Identity Sources > Settings > Synchronization > Modifications** and select *All*.
- **Remote application**  
Deploy an app that launches a Remote desktop session.
- **Remote control**  
Deploy a remote package to the user device and launch a **remote control** session for that device via your desired remote desktop software application.
- **Web application**  
Make a link available to your users, that launches when they click on the Workspace app or when they log in for example.

The **Superseded by products** information that appears in the **Create new package** window shows all the product versions within Application Workspace Setup Store that supersede the currently selected version.
