

Import Applications via Migration Utility

Last Modified on 2026-08-17

Using the Application Workspace Migration Utility, you can import applications from the following source platforms: Microsoft ConfigMgr (MECM), Microsoft Intune, PDQ Deploy, Jamf Pro, BigFix, Kandji.

For more information about the supported functionality for each data source, see [Supported Source Platforms](#).

To import applications into an Application Workspace Zone:

1. Review matches on the relevant **Matches** tab or items on an **Import** tab.
2. Use the **Search** box and/or **Platform** filter to narrow the list.
3. Check the ☒ column for rows to import, or use **Select All**.
4. Edit the **Name**, **Version**, or **Launch Command** inline, if needed.
5. Upload a custom icon using the **Upload** button in the Icon column (optional).
6. Click **Process Selected**.
7. Monitor progress in the progress bar or click **Cancel Operation** to abort.

If **Dry Run Mode** is enabled under **Settings > User preferences**, no changes will be made to the Zone. All operations will only be logged.
