

Flexera Snow

Last Modified on 2026-10-05

These settings are visible when **Flexera Snow** is enabled as a data source for application migration.

Create an OAuth client (client credentials) in Snow Atlas and note the region your tenant is hosted in.

- **Region:** Snow Atlas region, ex. westeurope, eastus (select from dropdown or enter a custom region)
- **Client ID:** OAuth client ID
- **Client Secret:** OAuth client secret (stored encrypted)
- **Flexera Snow App Prefix:** Optional prefix added to Zone package names created from Flexera Snow matches (default: Snow -)

Click **Test Flexera Snow Connection** to verify.

NOTE: Flexera Snow is a read-only inventory source — Application Workspace never writes back to Snow Atlas, and no installer files are downloaded from Snow Atlas.
