

Update Migration Utility

Last Modified on 2026-10-05

The Application Workspace Migration Utility can check for and install newer versions automatically.

To automatically check for updates, enable **Automatically check for updates on startup** in Settings.

TIP: You can manually check for updates anytime by clicking **Check for Updates** in the Help window (or by pressing **F1** to open Help).

If a newer version is available, you'll be prompted to install it.

Once you accept the update, the migration utility downloads the MSI installer, validates its digital signature (Authenticode), closes the application, and silently runs the installer (msiexec /qb) before relaunching.
